iContinuousIntegration

by Oleksandr Dodatko EPAM Systems

What's covered

Managing shared projects with xCode

Building a project without xCode GUI

Creating "universal binary" libraries

Deploying project and libraries for QA

More FUN for developers

Unit testing with GHUnit

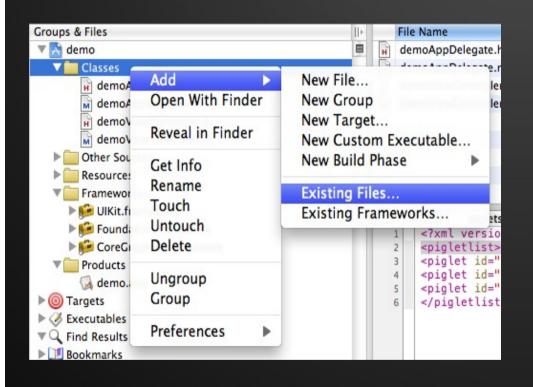

Using Hudson build server (it has Chuck Norris plug-in)

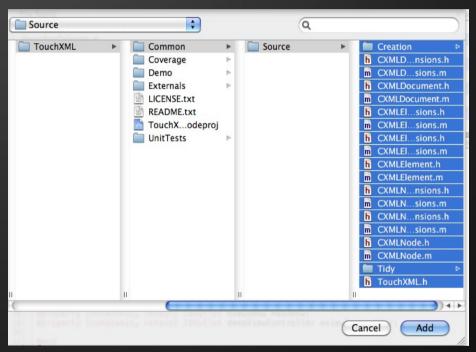

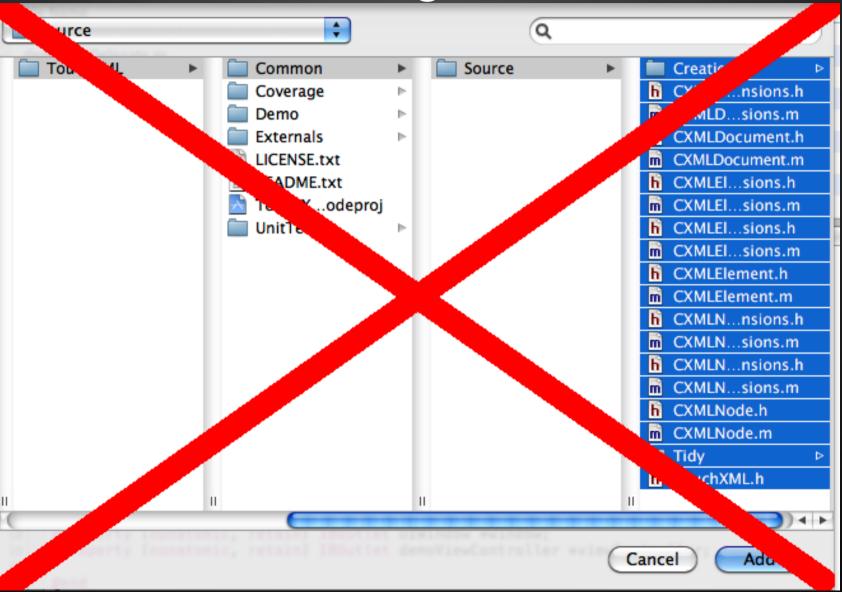

Running applications on simulator without xCode

"Commonly used" Project organization

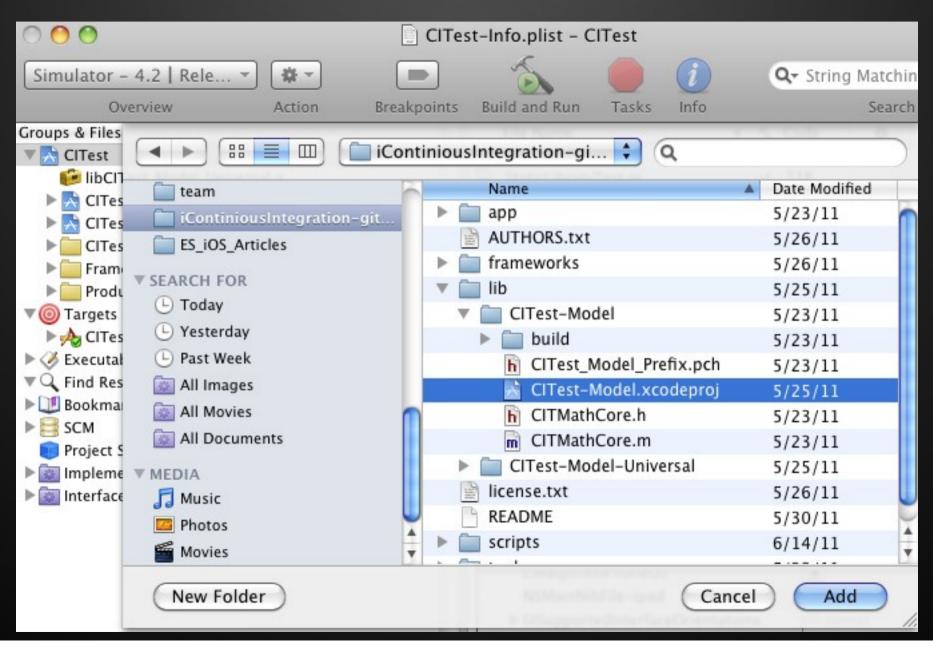

Wrong !!!

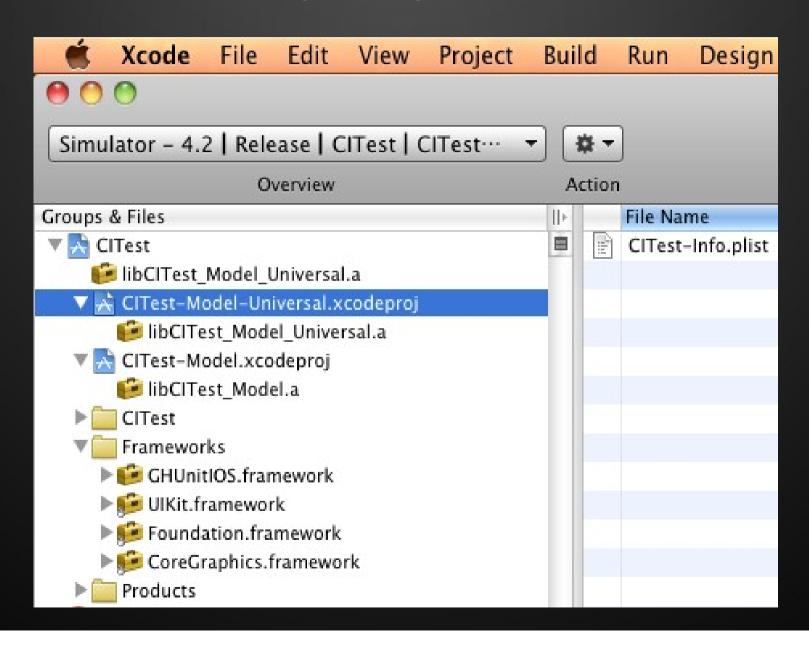

ONE Product, ONE XCODE PROJECT

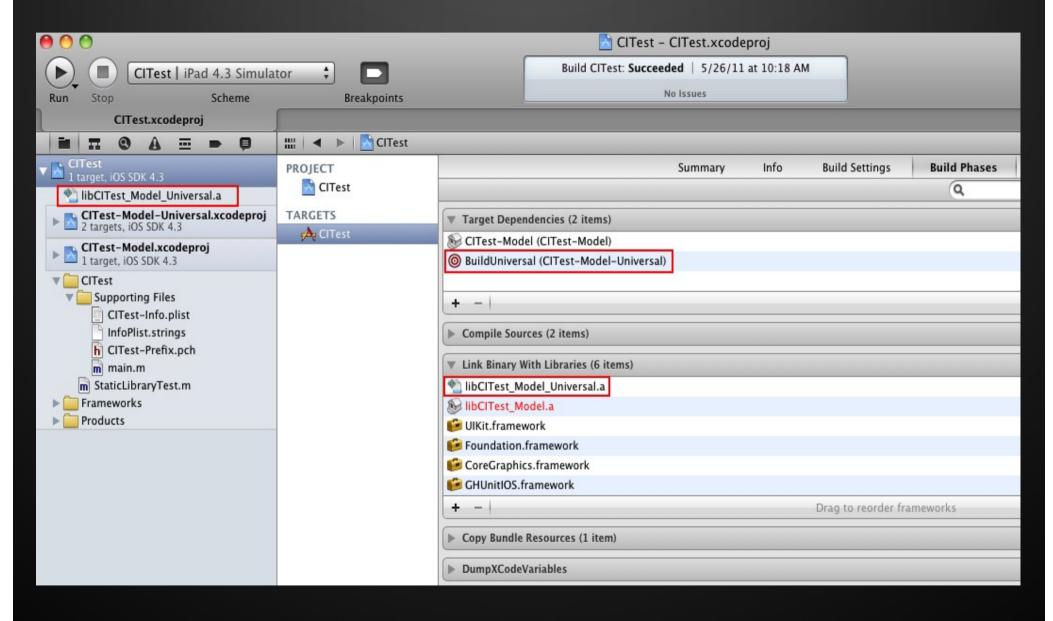

Library project howto

Library project howto

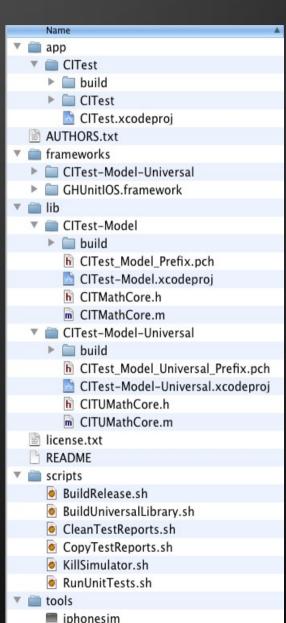

Setting up dependencies

Defining project structure

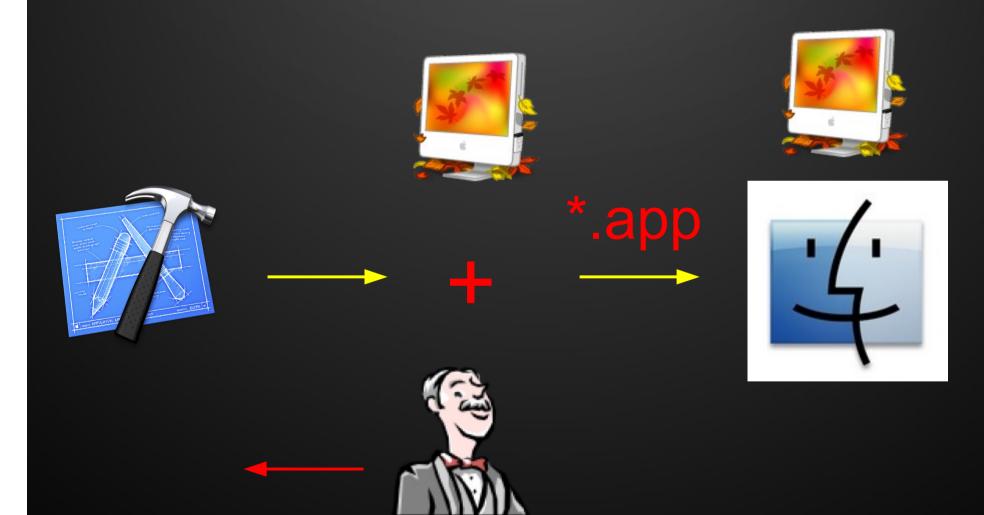

app lib frameworks scripts tools test certificates deployment

Deployment: Desktop vs. mobile

Desktop applications

Mobile

Mobile QA

Building without xCode GUI

xcodebuild -project \$PROJECT_NAME.xcodeproj

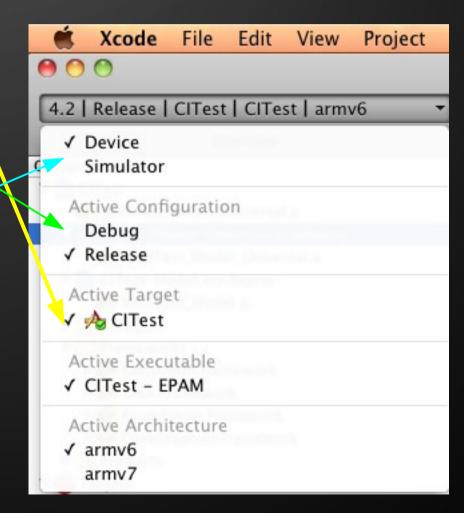

-target \$TARGET_NAME

-configuration Release.

-parallelizeTargets

-sdk iphonesimulator4.3

clean build

Creating *.ipa file

/usr/bin/xcrun

- -sdk iphoneos PackageApplication
- -v "\${BUILD_DIR}/Release-iphoneos/\$
 {PROJECT_NAME}.app"
- -o "\${DEPLOYMENT_DIR}/\$
 {PROJECT_NAME}.ipa"
- --sign "\${DEVELOPER_NAME}"
- --embed "\${PROVISONING_PROFILE}"

Product	Window	Help
Run		₩R
Test		жU

Attach to Process		•

How about unit testing?

Picking a framework

Running a test

Collecting results

Test frameworks chart

	SenTest	Google	GHUnit
Xcode integration	+	+	
UIKit Support			
Bundles support			+
Xml reports			+ (lack of support for hudson CI)
Runs on device	+ - (Runtime tests only)	+ - (Runtime tests only)	+
Runs on simulator	+ - (logic tests only)	+ - (logic tests only)	+
Debugging (out of box)			+
UI snapshots comparing		+	

GHUnit configuration

Add GHUnit.framework
Replace Main.h with the one from GHUnit
Remove "MainNibFile" entry from the info.plits

```
setenv( "GHUNIT_AUTORUN" , "YES", 1 );
setenv( "WRITE_JUNIT_XML", "YES", 1 );
```

// Not supported in the official GHUNIT setenv("GHUNIT_AUTOEXIT", "YES", 1);

Running test

```
"$TOOLS_DIR/iphonesim"
launch "$DEPLOYMENT_DIR/CITest.app"
4.2
ipad
```

NOTE: Use only FULL PATH to the app as shown above

Collect results

```
TEMP_DIR=$(/usr/bin/getconf DARWIN_USER_TEMP_DIR)
TEST_DIR_NAME=test-results
TEST_RESULTS_DIR=$TEMP_DIR$TEST_DIR_NAME
```

```
## Now we can just copy test results
cd "$TEST_RESULTS_DIR"
   pwd
   cp *.xml "$TEST_PUBLISH_DIR"
cd "$LAUNCH_DIR"
```

Terminating simulator

killall -s -KILL -c "iphonesim"

killall -s -KILL -c "iPhone Simulator"

killall -KILL -c "iPhone Simulator"

Do it before you run a test app

Universal binaries

- 1. Build a library version for the device.
- 2. Build a library version for the simulator.
- 3. Combine them to a single binary
- 4. Deploy universal library to the "frameworks" directory.

Combining binaries

```
lipo -create
"${LIB BUILD DIR}/Release-
iphoneos/libClTest Model Universal.a"
"${LIB BUILD DIR}/Release-iphonesimulator/
libClTest Model Universal.a"
-output "../frameworks/CITest-Model-
Universal/Lib/libClTest Model Universal.a"
```

Build script should

Build main products

Create *.ipa packages for main products

Build unit tests

Run unit tests with iphonesim

Package *.ipa and *.app entries to *.zip archive

Prepare unit test reports for deployment

Build server should

Checkout project sources
Run build script
Deploy product archives
Publish test reports
